Digital X-Ray & Oral Cameras

- 1) **EasyDent** has a direct link from patient screens to the most popular X-Ray and Imaging systems, including: **Apteryx**, **Dexis**, **EVASoft**, **Gendex**, **Schick**, **Suni**, **Tiger View**, **XDR Radiology**, **Visix**, and **VixWin**. We recommend **EVASoft by Image Works**; their imaging software comes free with their digital sensors.
- 2) Most digital x-ray & oral Camera software vendors provide specifications to program a bridge between practice management software and their imaging system. Whenever possible, we are always glad to create this software and provide the link free of charge.
- 3) **DataGrabber** is a Windows' System Tray application that understands how to bridge patients that you have open in one application to another application, starting it if necessary. This provides a bridge between **EasyDent** and many popular digital x-ray systems. www.apteryxware.com/datagrabber/
- 4) You can quickly and easily import any windows digital image file directly into the patients **EasyDent** Electronic Dental Record. As long as the image is a standard Windows format, or the imaging vendor software provides a device driver to view their file type.
- 5) **Imaging Packages**
No matter what type of x-ray or oral camera system you are using, as mentioned, above we provide a direct link to two of the most popular digital imaging packages, Apteryx and Tiger View. Find them at: www.apteryxware.com and www.tigerview.com
- 6) **Scan-X**
Some digital x-ray and oral camera systems don't provide the capability to build a software bridge. For example; Scan-x generally only licenses interface specifications to specific imaging vendors. You are forced to integrate via one of these imaging packages they contracted with. We highly recommend the **apteryx** imaging package if you are using the Scan-X type systems.
