Data Conversions

Data conversions range widely in difficulty. The cost of conversions is from $ 200 to $ 2500. Generally Patient demographics (name, address, birth date, social security number, telephone numbers, etc.), patient balances, insurance carriers and fee schedules are typically converted. Many times we are also able to capture financial ledger history (the detailed transactions).

We are glad to look at an existing system to evaluate the conversion possibilities and cost, at no charge. There are different methods to accomplish this.

1. If you have access to High Speed Internet, you can allow us to connect to your computer, under your control, and we can evaluate your current system to give you a price quote.

2. If you can back up your current system entirely onto a Zip Disk, CD, or USB Jump drive and mail it to us, many times we can restore it to our computers and check it out.

3. Some practices have even shipped us their old computer for the conversion.

4. Some systems have file export capabilities. If your current software can export data into ASCII "text", Excel "Spreadsheet", or Access "Database" format, we can generally use this data for the conversion.

Again, we can give you a fixed price quote once we see your current systems software and data files.
